PROFESSIONAL PROFILE

Hands-on AI automation builder and founder of NONSTOP AI, developing workflow automations, AI voice receptionist prototypes, and business websites. Experienced in connecting automation platforms, databases, webhooks, APIs, and front-end applications; validating workflows through execution logs and troubleshooting integration failures. Seeking freelance implementation engagements focused on practical, testable business systems.

TECHNICAL SKILLS

Automation & integrations: n8n, API and webhook integrations, scheduled workflows, lead processing, email workflow orchestration, error investigation.
Voice AI: AI receptionist workflows, Vapi/Bland concepts and configuration, Twilio integrations, caller identification and structured lead capture.
Data & web: Supabase, PostgreSQL, React, Vite, Tailwind CSS, Netlify.
Delivery: AI-assisted development with Claude, workflow testing, execution-log analysis, privacy-aware documentation.

RELEVANT EXPERIENCE

Founder / AI Automation Builder | NONSTOP AI | Independent projects

- Designed and operated a database-backed email outreach automation engine, integrating scheduled workflow execution, contact data, messaging logic, and delivery records.
- Built and tested AI receptionist functionality for caller identification and structured enquiry handling, connecting voice automation with backend data.
- Developed and deployed business website experiences using React-based front ends and Netlify hosting, with lead-capture workflows.
- Investigated operational failures using execution histories, database queries, and read-only audits; documented production versus test status.

SELECTED PROJECTS

1. Automated Email Outreach Engine | Internal system

Built an n8n and Supabase outreach system covering B2B lead sourcing, scheduled email, automated follow-ups, lead tracking and daily reporting. Internal system; no sales or revenue claimed.

2. AI Receptionist | Tested implementation

Built and tested an AI voice receptionist that answers inbound calls, recognises the caller through a backend lookup and captures structured enquiries for follow-up (Bland AI, Twilio, Supabase Edge Functions, n8n). Presented as tested, not as a proven paid-client deployment.

3. Website Machine | Built website system

Created responsive website templates and service pages with React/Vite/Tailwind and Netlify, incorporating enquiry capture and business-focused page structure. Demonstrates front-end implementation and deployment capability.

WORKING APPROACH

Translate operational problems into implementable workflows; connect tools and data sources; test outputs; diagnose failures; document limitations and handover requirements. Comfortable working with AI-assisted coding tools while verifying results against live systems.
